

SUMMARY

The World University Survey Dashboard is a Power BI data analytics project designed to analyse and visualize university survey data from different countries, academic programs, and fields of study. The dashboard provides insights into student satisfaction, overall university ratings, tuition trends, scholarship distribution, and online learning participation through interactive and user-friendly visualizations.

This project uses multiple charts and KPI cards to present important educational metrics such as total students, scholarship student count, average satisfaction score, and total tuition amount. It also compares campus facility ratings, country-wise university performance, and satisfaction levels across various fields of study including Computer Science, Business, Engineering, AI, and Medicine.

The dashboard was developed using Power BI, with data cleaning and transformation performed through Power Query and analytical calculations created using DAX measures. Different visualization techniques such as bar charts, line charts, donut charts, tree maps, and waterfall charts were used to make the data easy to understand and visually appealing.

The main objective of this project is to demonstrate how data visualization and business intelligence tools can help analyse educational survey data and generate meaningful insights for better academic analysis and decision-making.
